Re-ranking is a second-stage filtering process in retrieval systems, especially in RAG pipelines, where we:

- 1. First use a fast retriever (like BM25, FAISS, hybrid) to fetch top-k documents quickly.
- 2. Then use a more accurate but slower model (like a cross-encoder or LLM) to re-score and reorder those documents by relevance to the query.

RAG Pipeline

👉 It ensures that the most relevant documents appear at the top, improving the final answer from the LLM.

1) Retrivat

2) Rc-Ranking

3) Generation

Practical

| Why Use Rerankers in a RAG Pipeline ■ | | | | | | | |
|---------------------------------------|--|---|--|--|--|--|--|
| Reason | Without Reranker | With Reranker | | | | | |
| 1. Relevance of Context | Top-k documents may be loosely or partially related | Top-k documents are re-scored and reordered for maximum relevance | | | | | |
| 2. Factual Accuracy | LLM may hallucinate if poor context is retrieved | Irrelevant docs are filtered out → grounded, factual answers | | | | | |
| 3. Handling Ambiguity | Retriever lacks deep understanding of query intent | Reranker evaluates full query–doc pair → better intent alignment | | | | | |
| 4. Semantic Matching | Dense retrievers may miss low-similarity but relevant docs | Reranker uses deeper models (cross- encoders / LLMs) | | | | | |
| 5. Keyword vs Meaning | BM25 may favor exact match even if not meaningful | Reranker balances semantic and lexical relevance | | | | | |
| 6. Prioritization of Evidence | All retrieved docs treated equally | Most relevant documents float to the top | | | | | |
| 7. Long-Tail Queries | Weak retrievers struggle with uncommon queries | Rerankers better capture rare but meaningful matches | | | | | |
| 8. LLM Efficiency | Poor context leads to verbose or incorrect answers | High-quality context improves precision and conciseness | | | | | |
| 9. Noise Reduction | Noisy docs (ads, unrelated text) may slip in | Reranker pushes noisy docs to the bottom or filters them out | | | | | |
| 10. Flexible Scoring Strategies | Fixed retriever scoring | Reranker can include metadata, recency, user preferences | | | | | |
